1   INTRODUCTION

⚠️ 📖	# IMPORTANT!
	This handbook must be handed over to the user prior to installation and commissioning of the unit. *Read the "General prescriptions for use" handbook supplied separately from this manual before installing and commissioning the unit.* *The meaning of the symbols in this manual and the associated precautionary information are given in the "General prescriptions for use".* *If the "General prescriptions for use" are not present, it is mandatory to request a replacement copy from the manufacturer or from your dealer.* *Retain these documents for future consultation.*

KEY

⚠️	# DANGER!
	This pictogram warns of danger of death or serious injury.

⚠️	# WARNING!
	This pictogram warns of a risk of injury or damage to property.

⚠️	# CAUTION!
	This pictogram warns of a potentially hazardous situation.

☞	# INFORMATION!
	This pictogram gives important information concerning the execution of the relevant operations.

NOTE
The figures in this manual are simply provided to depict the operations and may contain differences with respect to the actual equipment to which they refer.

2   INSTALLATION AND ASSEMBLY

2.1   CONNECTIONS AND SOCKETS

Pin	Signal
1	CANH_A
2	CANL_A
3	+15V_CAN
4	GND_CAN
2.2 INSTALLATION

<table>
<tr>
<td>⚠️</td>
<td>DANGER!
Lifting and positioning</td>
</tr>
<tr>
<td colspan="2">Read the warnings highlighted by the following symbols in the "General prescriptions for use".</td>
</tr>
</table>
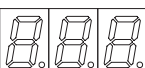

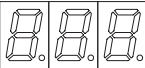

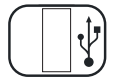

Connect **RC-205** to the different devices via the cables as demonstrated in picture.
    ○ Remote controller connector [Item 1].

3   USER INTERFACE
CODE	SYMBOL	DESCRIPTION
L1	HOLD	When the indicator light goes on, it shows the last voltage and current value measured during the welding operation on displays D1 and D2. The LED is switched off when a new welding procedure is started, or when any of the welding settings is changed.
D1		**During the welding operation:** The display shows the effective amperes used when welding. **With HOLD led on:** The display shows the last measured current value..
D2		**During the welding operation:** The display shows the effective voltage used when welding. **With HOLD led on:** The display shows the last measured voltage value.
LCD		The display shows the menus available to set up the welder and its functions. **During the welding operation:** The display shows the welding parameters set.
S1, S2, S3, S4, S5, S6		**Multi-function keys:** these keys are associated with specific functions, which vary according to the currently viewed menu screens and to the currently used settings. The function assigned to each key is shown by the icon that appears next to it.
ENC/S7		**ENCODER WITH BUILT-IN KEY** **In the menu screens:** By using the encoder, the parameters/settings list can be scrolled. By pressing the encoder (ENCODER KEY) the highlighted settings can be selected. **During the welding operation:** the encoder changes the value of the active parameter.
USB		Porta per connettere una chiavetta USB per l'esportazione/importazione dei JOB. Tramite la porta USB è possibile aggiornare il firmware di sistema dell'impianto

☞ The touchscreen panel allows the user to set up the functions through the mechanical keys or by touching the icons displayed on the screen.

RC-205

3.1 MAIN SCREEN

KEYS WITH SYMBOLS

	- (MIG/MAG): The (PROGRAM) key allows the user to access a sequence of screens to be used to program the parameters required to specify a welding curve. - (MMA): Press the (PROGRAM) key to select the type (material) of electrode.
	The (FAVORITE) key allows the user to access the SHORTCUT menu, which allows the ⬚ (SHORTCUT) keys to be associated to a specific function selected from the available functions.
	Press the (PROCESS) key to select the welding process. The following processes can be selected: PULSED MIG/MAG, MIG/MAG SHORT/SPRAY, MMA, ARC AIR, TIG LIFT. In MIG/MAG mode the user can select through a sequence of screens the welding processes compatible with the material, wire diameter and gas values which have been previously set through the program key.
	The (PARAMETERS MENU) allows the user to access the menu used to set up the main welding features. This menu also contains special functions, such as the welding circuit calibration and the system menu. It also contains special functions, such as: the welding circuit calibration, the system menu, import/export.
	The (MODE) key allows the user to access the menu used to select the torch trigger mode.
	The (JOB) key allows the JOB management menu to be accessed.
	The (SHORTCUT) key allows the associated function to be directly accessed. By pressing this key, the function is enabled (yellow background); by pressing it again, the function is disabled. This key only works with the touch screen. Keep the ⬚ (SHORTCUT) key pressed for 3 seconds to access the functions screen.

3.2   SETTING UP THE WELDING PARAMETERS

This area of the screen displays the welding parameters that can be directly set from the main screen.
1.   Turn the encoder to select the parameter to be changed; the selection made is highlighted by the thicker edge around the box.
2.   Press the (ENCODER) key; the background of the box will change colour.
3.   Turn the encoder to set the desired value.
4.   Press the (ENCODER) key again to return to the parameter selection mode.

The following parameters can be set:
U **20.0** **V**	(MIG/MAG) Welding voltage Sets the welding voltage.
I **140** **A**	(MIG/MAG, MMA, ARC AIR, TIG LIFT) Welding current Sets the welding current.
⊶ **10.4** **m/min**	(MIG/MAG) Wire speed Sets the wire speed for welding.

WECO
WELD THE WORLD

3.4 mm
(MIG/MAG)
Material thickness
Sets the thickness of the material to be welded.

0.5
(MIG/MAG)
Arc length correction
Sets up the welding arc length correction in relation to the preset value from the synergic curve.

0.0
(MIG/MAG)
Inductance (in the short-spray process)
Changes the energy when a short circuit occurs.

0.0
(MIG/MAG)
Dynamic (in the pulsed process)
Corrects the energy of the pulsed arc pulses.

1
(MIG/MAG, MMA, ARC AIR, TIG LIFT)
Selected JOB
Displays the currently loaded JOB.
The icon is displayed only if a JOB is loaded.

50%
(MMA)
Hot-start
Set the HOT-START peak current value to allow the electrode welding to be easily triggered.

40%
(MMA)
Arc-Force
Set the ARC-FORCE peak current value to allow the electrode to slide during the welding process and to prevent electrode sticking.

CC
(MMA)
Dynamic (in the electrode welding process)
Changes the short-circuit energy when the drop is detached

VIEWING ADDITIONAL INFORMATION

During a parameter setting operation The bar displays the minimum value, the currently set value and the selected parameter maximum value.	**Outside a parameter setting operation** The active welding settings are displayed (filler wire material, gas, thickness of the material to be welded, b-level activation, double pulse mode activation, loaded JOB).

After activating a function
Below the active synergic curve wording, the icons of the active functions will appear.

RC-205
4.4.2   WIRE FEEDER SETUP

Enable when a WF-205p wire feeder is installed on a 405dms-505dms generator.

WIRE FEEDER SET UP enables the reception of commands from potentiometers of an external wire feeder unit.

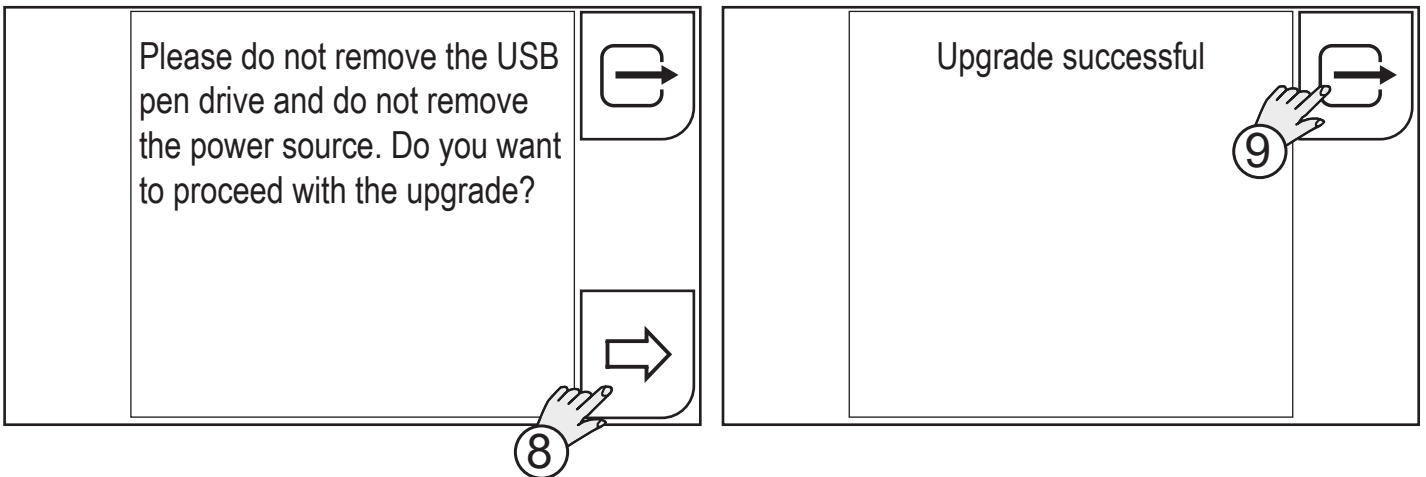

1.   Turn the encoder to select the desired setting. Select the following path: Wire Feeder setup>
2.   Press the (ENCODER) key or the (NEXT) key to confirm.
3.   Press the (ENCODER) key to apply the parameter change.
4.   Turn the encoder to set the desired value.
5.   Press the (ENCODER) key or the (NEXT) key to confirm.

To exit the screen, press the ⟶ key.

6.   The symbol ▱ (REMOTE) appears on the main screen when parameters which can be set by the wire feeder potentiometers are selected.

POT1 regulates the adjustment of parameters (wire speed/ampere/tension/material thickness) with respect to values preset from the synergic curve.

POT2 regulates the welding arc length correction in relation to the preset value from the synergic curve.

4.4.3   COOLING UNIT SETUP
1. Turn the encoder to select the desired setting. Select the following path: CU setup>
2. Press the (ENCODER) key or the (NEXT) key to confirm.
3. Press the (ENCODER) key to apply the parameter change.
4. Turn the encoder to select the desired setting.
5. Press the (ENCODER) key to confirm your selection.

To exit the screen, press the ⊟➔ key.

○ **AUTO:** When the welder is switched on, the unit is switched on for 30 s. During the welding operations, the unit runs continuously. When the welding operation is completed, the unit will stay on for 90 s plus a number of seconds related to the welding average current value.
○ **ON:** The cooling unit is always on when the current generator is also switched on. This mode is preferable for heavy duty and automatic welding procedures.
○ **OFF:** The cooling unit is always off; this function must be selected if an air cooled torch is used.

4.4.4 DISPLAY SETUP

The display setup option allows the user to select the parameters to be displayed in the main screen and the order in which they are displayed.

1. Turn the encoder to select the desired setting. Select the following path: Display setup>
2. Press the (ENCODER) key or the (NEXT) key to confirm.
3. Turn the encoder to select the desired box.
4. Press the (ENCODER) key or the (NEXT) key to confirm.
5. Turn the encoder to select the desired parameter.
6. Press the (ENCODER) key or the (SAVE) key to confirm.

To exit the screen, press the ⎆ key.

DISPLAY SETUP

BOX1

BOX2
7. The display setup screen is associated with the welding process. Press repeatedly the process key to scroll the various welding process setup screens.
8. Personalised display setups can be exported o imported by means of the export/import keys. (See chapter "4.4.8 IMPORT / EXPORT" on page 35).

4.4.5   PUSHPULL SETUP

👉	***INFORMATION!***
	This menu item is always present. Nevertheless, in order to use the PushPull torch, you must first install the PushPull kit in the wire feeder).

You can install a PushPull torch. When you want to enable the PushPull torch motor command, you must enable this function.
1.   Turn the encoder to select the desired setting. Select the following path: PushPull> setup
2.   Press the (ENCODER) key or the (NEXT) key to confirm.
3.   Turn the encoder to select the desired setting.
4.   Press the (ENCODER) key or the (SAVE) key to confirm.

Press the key ⬛ to exit the screen.

4.4.6   ROBOT INTERFACE SETUP

☞	### *INFORMATION!*
	This menu item appears only in the generators set up to connect to a system for ROBOT applications.

The IROB SETUP menu lists the available communication interface types. This menu is used to configure the parameters for communication between the generator and the ROBOT. On the basis of the type of communication used, different types of setting are necessary that can be actuated via the various submenus.
1.   Turn the encoder to select the desired setting. Select the following path: IRob Setup>
2.   Press the (ENCODER) key or the (NEXT) key to confirm.
3.   Turn the encoder to select the desired setting.
4.   Press the (ENCODER) key or the (NEXT) key to confirm.

Press the key ⬐ to exit the screen.

The data for configuring the network interface must be keyed in on the alphanumeric keypad.

☞   The touchscreen panel allows the user to set up the functions through the mechanical keys or by touching the icons displayed on the screen.

WELD THE WORLD

5   MIG/MAG WELDING

5.1   WELDING CIRCUIT CALIBRATION

By using the WELDING CIRCUIT CALIBRATION guided procedure, the resistance and inductance values of the welding circuit are measured. When the wire feeder is used with its cable harness, the welding circuit "r" resistance can be measured by using the calibration function. This allows to achieve a consistent welding quality when the cable harness length and the torch is changed. The welding circuit resistance depends on the cable harness and on the torch used; we therefore recommend that the calibration procedure is repeated when these components are changed. If a generator full RESET procedure is carried out, the default calibration value will be restored. If a partial RESET is carried out, the measured value will be stored. The calibration is not compulsory therefore, if the user decides not to carry it out, the machine will use the default value.
The generator must be on and not set up for welding.
1.   Press the (MENU) key.
2.   Turn the encoder to select the desired setting. Select the following path: Calibration>
3.   Press the (ENCODER) key or the (NEXT) key.
4.   Press the (ENCODER) key or the (NEXT) key or the torch trigger to confirm.
5.   Press the (ENCODER) key or the (NEXT) key or the torch trigger to confirm.

Code 006.0001.2250

ENGLISH

WECO
WELD THE WORLD

RC-205

WELDING CALIBRATION

Step2

Remove the gas nozzle from the torch

WELDING CALIBRATION

Step3
Touch the workpiece with the guide wire
tip and press the torch trigger
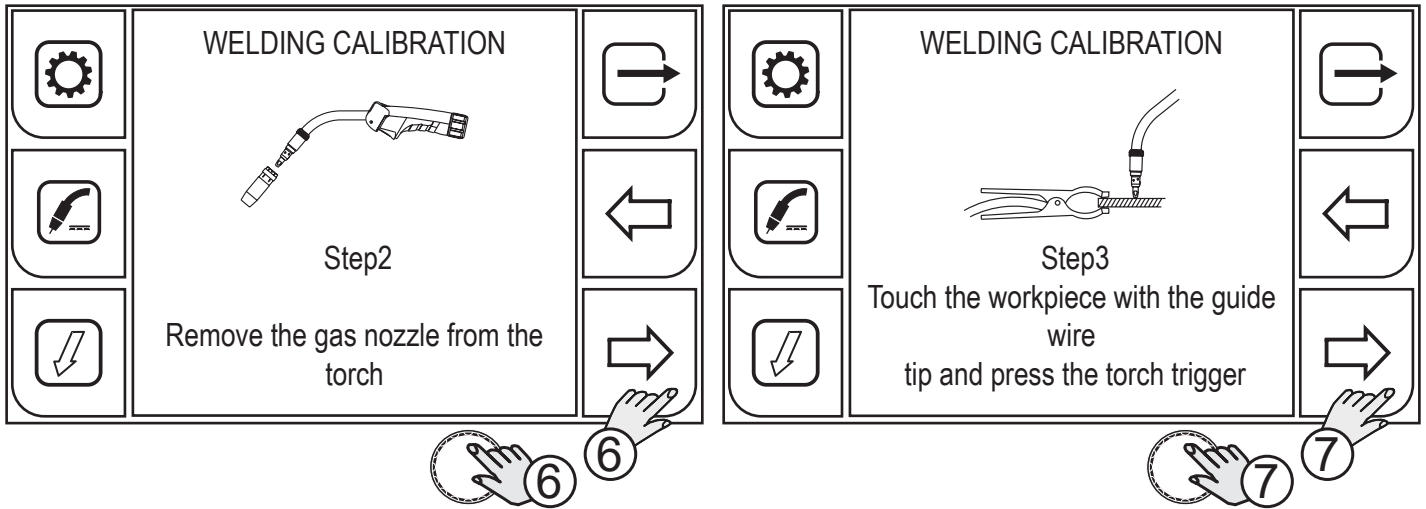

6. Press the (ENCODER) key or the (NEXT) key or the torch trigger to confirm.
7. Press the (ENCODER) key or the (NEXT) key or the torch trigger to confirm.

At the end of the procedure, the measured welding circuit resistance and inductance values will be displayed.
By doing so, a consistent welding quality can be achieved when the length of the cable harness, of the earth cable and of the torch changes.
Should the measurement be unsuccessful, the "CALIBRATION ERROR" message will be displayed.

WECO
WELD THE WORLD

5.2   GAS FLOW REGULATION

5.2.1   VERSION WITHOUT FLOWMETER

When the unit is powered on, the solenoid valve is enabled for 1 second.
This fills the gas circuit.

WIREFEEDER WF-205p
1.   Open the gas solenoid valve by pressing and releasing the (GAS) key.

2.   Regulate the pressure of the gas flowing from the torch by means of the flow meter connected to the gas cylinder.

WIREFEEDER WF-205p
3.   Close the gas solenoid valve by pressing and releasing the (GAS) key.
The solenoid valve is automatically closed after 30 seconds.

Code 006.0001.2250

WECO
WELD THE WORLD

RC-205

ENGLISH

5.2.2   VERSION WITH FLOWMETER

An external flowmeter can be installed (gas kit) to measure the flow rate (litre/minute) of gas used. When the flowmeter is installed, the gas measurement can be corrected by adjusting a coefficient.

The flow rate of gas used is automatically calculated according to the welding curve selected. If a specific gas is used (for example, a ternary gas or special mixtures) not included in the GAS MENU list, it may be necessary to correct the measurement by using the GAS SETUP parameter. The flow rate of the gas in the external flow meter must be read and the GAS SETUP must be adjusted so that the value displayed on the screen matches the value read in the gas flow meter.

To correctly measure the gas flow rate exiting the torch, we recommend that a gas flow meter is used, to be applied directly to the torch outlet.

-   Open the gas solenoid valve by pressing and releasing the ⬭ (GAS) key.
-   Read the gas flow rate detected by the gas flow meter.
-   Follow the procedure described below to set up the gas flow meter correction.
1.   Press the (MENU) key.
2.   Turn the encoder to select the desired setting. Select the following path: System>
3.   Press the (ENCODER) key or the (NEXT) key to confirm.

10. Press the (ENCODER) key or the (NEXT) key to confirm.

Press the ⟶ key to exit the screen.

5.3   TORCH LOADING

⚠️	*WARNING!*
	Make sure the torch in use is correctly sized in relation to the welding current required and for the available and selected cooling type. This prevents the risk of burns to which the operator is potentially exposed, potential faults, and irreversible damage to the torch and the system. *If a torch is installed or replaced while the unit is running, the circuit of the newly installed must be filled with coolant to avoid the risk of damage to the torch in the case of high voltage arc strikes without any liquid in the circuit.*

When the generator is switched on, the presence of coolant in the cooling circuit will be automatically checked and the cooling unit will be switched on for 30 seconds.
If the coolant circuit is full, the power generator restores the most recent stable welding setup.
If the coolant circuit is not full, all functions are inhibited and there will be no output power.
The following alarm message will be displayed: E50 - COOLING UNIT ALARM

E50 - COOLING UNIT ALARM
1.   Press the (EXIT) key to repeat the torch filling procedure until the alarm is no longer displayed.

PROCESS (1 LEVEL): allows only the welding processes compatible with the previously carried out settings to be selected.
8.   Turn the encoder to select the desired setting.
9.   Press the (ENCODER) key or the (NEXT) key.

PROCESS (2 LEVEL): Allows a specific mode of a previously selected welding process to be selected.
10. Turn the encoder to select the desired setting.
11. Press the (ENCODER) key or the (SAVE) key to confirm the program.

Press the ⇐ (PREC) key to return to the previous screen.

To return to the main screen without saving the changes, press the ⇥ (EXIT) key.

5.4.1 MIG/MAG WELDING PROCESSES

MANUAL MIG/MAG WELDING
Welding is of the Short/Spray type.
- short arc: the drop is detached after a low amperage short-circuit.
- globular: this is the phase occurring between the short arc and the spray arc.
- spray arc: the material is deposited when high amperages occur without short-circuits.
The main welding parameters, the wire speed, the voltage and inductance values are adjusted by the operator.
The optimal work point must be identified for the required welding type.

SYNERGIC MIG/MAG WELDING
Welding is of the Short/Spray type.
- short arc: the drop is detached after a low amperage short-circuit.
- globular: this is the phase occurring between the short arc and the spray arc.
- spray arc: the material is deposited with high amperages without short-circuits occurring.
The welding related data (material, wire diameter, gas type) must be set up, as well as a single welding parameter amongst wire speed, amperage, material thickness and voltage.
The generator automatically adjusts the other secondary parameters that affect the welding quality.

PULSED MIG/MAG WELDING
The pulsed process is a welding process where material deposition is controlled by carrying out an accurate regulation of the current pulse.
The welding related data (material, wire diameter, gas type) must be set up, as well as a single welding parameter amongst wire speed, amperage, material thickness and voltage.
The generator automatically adjusts the other secondary parameters affecting the welding quality.

SYNERGIC MIG/MAG WELDING (POWER MIX)
The process combines the short/spray process and the pulsed process and aims at reducing the average heat input in order to be able to perform vertical up or corner welds in all positions with an excellent aesthetic quality of joints and no defects.
The benefits in welding are:
- Quality of vertical up and corner welds
- Simple and fast set-up thanks to the synergic programs
- Good speed of execution
- Low heat input and less deformation
- High aesthetic quality of joints
- Low risk of typical defects especially in critical positions such as vertical up welds
- Applicable on different types of steel and thicknesses

5.4.2 MIG/MAG WELDING FUNCTIONS

DOUBLE PULSE SYNERGIC MIG/MAG WELDING

The DOUBLE PULSE is a function available in the synergic MIG/MAG and in the pulsed MIG/MAG welding process. This function allows the two wire feed speeds to be controlled.

The welding related data (material, wire diameter, gas type) must be set up, as well as a single welding parameter amongst wire speed, amperage, material thickness and voltage.

The generator automatically adjusts the other secondary parameters that affect the welding quality.

HC (HIGH CONTROL) SYNERGIC MIG/MAG WELDING

The HC ((High Control) function is provided to quickly control the arc in order to optimise the drop detachment with a greatly reduced energy.

The welding benefits are:
- Increased arc stability
- Very reactive arc to the torch movement
- Reduced energy transmitted to the welded workpiece
- Very linear transfer and optimal edge wettability
- Very fast operation
- Spatters and micro projections almost entirely absent.

PF (POWER FOCUS) SYNERGIC MIG/MAG WELDING

The difference between a standard MIG MAG and Power Focus is its concentration and pressure. The POWER FOCUS arc concentration allows the welder to focus the high temperature of the arc in the central section of the deposition, thus avoiding to overheat the sides of the welding. The thermally changed area with the Power Focus arc is less widespread.

The welding benefits are:
- higher penetration and lower risk of sticking
- increased welding speed
- higher arc stability even with long stick-outs
- lower costs of joint preparation
- reduced volumes of bevels to be filled

PR (POWER ROOT) SYNERGIC MIG/MAG WELDING

Power Root is an optimised short arc transfer with the feature of having a cold drop transfer. Power Root allows to achieve a very high quality in root passes.

The welding benefits are:
- optimal first pass
- quality of descending vertical welding
- excellent operability
- cold transfer of welding drop
- perfectly jointed thin metal sheets
- ideal for welding joints with large gaps

5.5   SETTING UP THE MIG/MAG TORCH TRIGGER MODE
1.   Press the (MODE) key.
From within the menu screen, the torch trigger mode can be selected.

(2 STROKES) -   (4 STROKES) -   (CRATER 2 STROKES) -   (CRATER 4 STROKES)

2.   Turn the encoder to select the desired setting.
3.   Press the (ENCODER) key or the (SAVE) key to only set up the torch trigger mode, otherwise carry out the procedure shown in paragraph (4).
4.   Press the (MENU) key.
According to the torch trigger mode selected, different process parameters to be set are available.

5.5.1 PROCESS PARAMETERS WITH TORCH TRIGGER IN 2 STROKE AND 4 STROKE MODE
1. **PRE GAS**
Time of gas delivery before the arc strike.
NOTE: if too long, it will slow down the welding procedure. Other than in the presence of special requirements the value should generally be kept at 0.0 s or anyway very low.

Available range: minimum (0.0 s) - default (0.1 s) - maximum (20.0 s)

2. **WIRE RETRACT**
The value is associated with the amount of wire to be retracted at the end of the welding operation.

Available range: minimum (0.0 s) - default (0.0 s) - maximum (10.0 s)

3. **POST GAS**
Time of post gas delivery when the welding arc is extinguished.

Available range: minimum (0.0 s) - default (2.0 s) - maximum (20.0 s)

5.5.2 PROCESS PARAMETERS WITH TORCH TRIGGER IN CRATER 2 STROKE MODE

1. **PRE GAS**
Time of gas delivery before the arc strike.
NOTE: if too long, it will slow down the welding procedure. Other than in the presence of special requirements the value should generally be kept at 0.0 s or anyway very low.

Available range: minimum (0.0 s) - default (0.1 s) - maximum (20.0 s)

Code 006.0001.2250

WECO
WELD THE WORLD

RC-205

2. **STARTING CURRENT**
The parameter adjusts the 1st level wire feed rate as a percentage of the wire feed rate set for welding (2nd level).

Available range: minimum (10 %) - default (130 %) - maximum (200 %)

3. **INITIAL ARC CORRECTION**
This parameter corrects the synergic voltage value relative to the synergic point of the synergic and pulsed MIG/MAG processes, while it manages correction of the voltage of the high value in the MIG/MAG double pulsed process.

Available range: minimum (-10) - default (0.0) - maximum (10)

4. **INITIAL CURRENT TIME**
This parameter specifies for how long the initial current is maintained.

Available range: minimum (0.0 s) - default (0.5 s) - maximum (10.0 s)

5. **SLOPE1**
This parameter controls the slope time connecting the HOT START level and the welding level.

Available range: minimum (0.1 s) - default (0.5 s) - maximum (10.0 s)

6. **SLOPE2**
This parameter controls the slope time connecting the welding level and the crater filler level.

Available range: minimum (0.0 s) - default (0.5 s) - maximum (10.0 s)

7. **FINAL CURRENT**
This parameter adjusts the crater filling wire feed rate as a percentage of the wire feed rate set for welding (2nd level).

Available range: minimum (10 %) - default (80 %) - maximum (200 %)

8. **FINAL ARC CORRECTION**
This parameter corrects the synergic voltage value relative to the synergic point of the synergic and pulsed MIG/MAG processes, while it manages correction of the voltage of the high value in the MIG/MAG double pulsed process.

Available range: minimum (-10.0) - default (0) - maximum (10.0)

9. **FINAL CURRENT TIME**
This parameter specifies for how long the final current is maintained.

Available range: minimum (0.0 s) - default (0.5 s) - maximum (10.0 s)

10. **POST GAS**
Time of post gas delivery when the welding arc is extinguished.

Available range: minimum (0.0 s) - default (2.0 s) - maximum (20.0 s)

11. **WIRE WITHDRAWAL**
The value is associated with the amount of wire to be withdrawn at the end of the welding operation.

Available range: minimum (0.0) - default (0.0) - maximum (10.0)

- The wire advances at the approach speed until making contact with the work. If the arc does not strike after 10 cm wire protrusion, wire feeding is locked and the welding unit outputs are de-energized.
- The welding arc strikes and the wire feed rate changes to the first welding level (hot start), which is set as a percentage of the normal welding feed rate.
- This first level is used to create the weld pool: for example, when welding aluminium a value of 130 % is recommended.
- The hot start level continues for the start time, which is settable in seconds; then switch to normal welding speed is performed in accordance with the start slope, which can be set in seconds.
- ○ Release (2S) the torch trigger to switch to the third welding level (crater filler), which is set as a percentage of the normal welding feed rate.
- The switch of welding current level in terms of crater filling is performed in accordance with the crater ramp, which can be set in seconds.
- This third level is used to complete the weld and fill the final crater (crater filler) in the weld pool: for example, when welding aluminium a value of 80 % is recommended.
- The crater filler level continues for the crater filling time, which is settable in seconds; at the end of this time welding is interrupted and the post gas stage is performed.

5.5.10 MMIG/MAG CRATER 4S OPERATION

⤓ : press the torch trigger

⤒ : release the torch trigger

⇕ : press and release the torch trigger

1. approach speed
2. pre gas
3. post gas
4. welding current
5. hot start
6. start slope
7. crater filling slope
8. crater filling time

- ○ Bring the torch up to the workpiece to be welded.
- ○ Press (1S) torch trigger.
- The wire advances at the approach speed until making contact with the work. If the arc does not strike after 10 cm wire protrusion, wire feeding is locked and the welding unit outputs are de-energized.
- The welding arc strikes and the wire feed rate changes to the first welding level (hot start), which is set as a percentage of the normal welding feed rate.
- This first level is used to create the weld pool: for example, when welding aluminium a value of 130 % is recommended.
- ○ Release (2S) trigger to switch to normal welding speed; then switch to normal welding speed is performed in accordance with the start slope, which can be set in seconds.
- ○ Press the torch trigger again (3S) to switch to the third welding level (crater filling), which is set as a percentage of the normal welding feed rate.
- The welding level is changed from the crater filling mode by using the crater slope that can be specified in seconds.
- This third level is used to complete the weld and fill the final crater (crater filler) in the weld pool: for example, when welding aluminium a value of 80 % is recommended.
- ○ Release the torch trigger a second time (4S) to close the weld and run the post gas procedure.

▲ : release the torch trigger

⇅ : press and release the torch trigger

1.	approach speed
2.	pre gas
3.	post gas
4.	welding current
5.	hot start
6.	start slope
7.	crater filling slope
8.	crater filling time
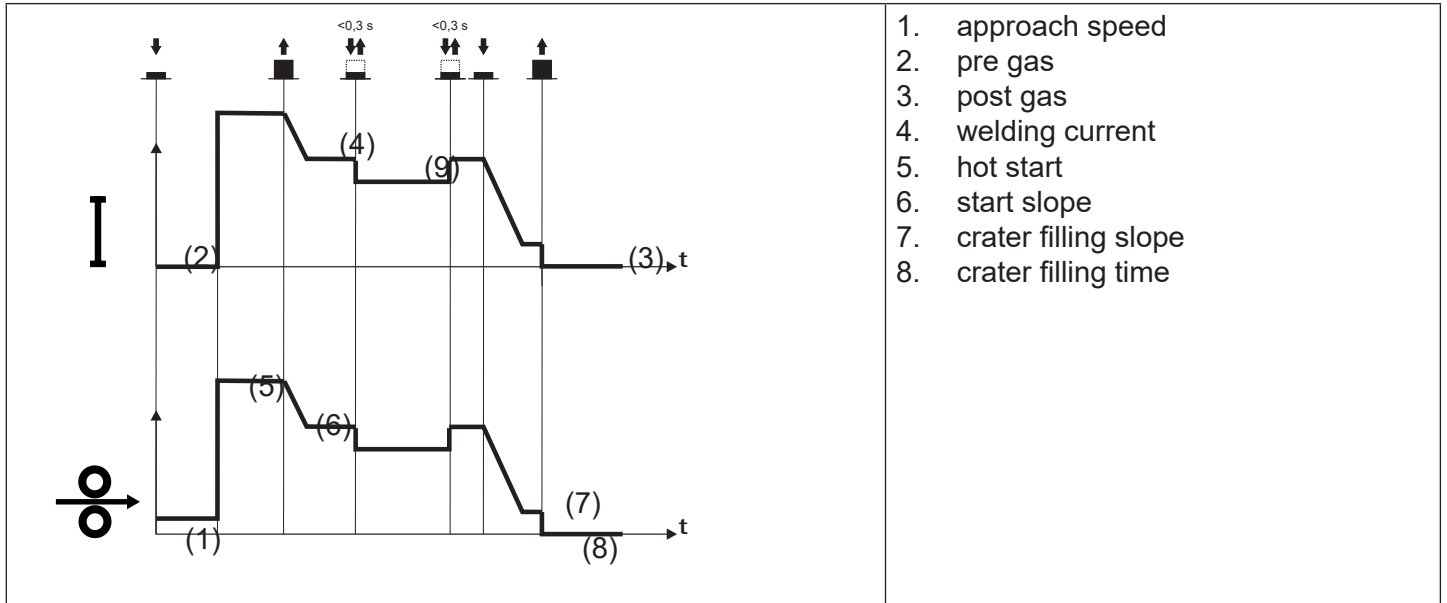

The welding process is the same as the crater 4S process; however, in this case, during the normal welding speed, if the torch trigger is pressed and released, the second welding current is applied.
The trigger must not be pressed for more than 0.3 seconds; otherwise, the weld completion stage will start.
When the trigger is pressed and released immediately, the system returns to the welding current.
Press (3S) and keep it pressed to start the crater filling procedure.
The weld is closed in the same way as with the crater 4S process.

WELD THE WORLD

6 PARAMETERS SETTING

The 📄 (PARAMETERS MENU) key allows the user to access the menu used to set the main welding features. This key also features special functions such as the welding circuit calibration and the system menu.
Press the (MENU) key.
1. Turn the encoder to select the desired setting.
2. Press the (ENCODER) key or the (NEXT) key.
Use this method to program all the sequentially displayed screens:

- PROCESS
  By using the PROCESS PARAMETERS menu, the values of the parameters associated with the set torch trigger mode can be set.

- DOUBLE PULSE
  by using the DOUBLE PULSE PARAMETERS menu, the values of the parameters associated with the DOUBLE PULSE welding process can be set.

- POWER MIX
  The POWER MIX PARAMETERS menu can be used to set the parameter values for the POWER MIX welding process.

- WELDING SETUP
  by using the WELDING SETUP menu, the available operating modes for the torch trigger can be enabled and the torch trigger parameters can be set.

- CALIBRATION
  by using the WELDING CIRCUIT CALIBRATION guided procedure, the resistance and inductance values of the welding circuit are measured.

- SYSTEM
  the SYSTEM menu includes several submenus:
  • LANGUAGES: to set the language used to display the messages
  • FW UPGRADE: to update the equipment software by using the USB memory stick.
  • ALARM LIST: allows the user to view a list of the alarms detected.
  • DATE & TIME: sets the time zone, the date and the time.

6.2.1   DOUBLE PULSE PARAMETERS
DOUBLE SPEED ACTIVE
This parameter enables/disables the double pulse mode.

Available range: minimum (0.0 s) - default (0.1 s) - maximum (20.0 s)

1.   **WELDING CURRENT**
This parameter regulates the average amperage of the welding arc.

Available range: minimum (30 A) - default (30 A) - maximum (200 A)

2.   **ARC LENGTH**
This parameter corrects the synergic voltage value relative to the synergic point of the synergic and pulsed MIG/MAG processes, while it manages the correction of the voltage of the high value in the MIG/MAG double pulse process.

Available range: minimum (-10) - default (0.0) - maximum (10)

3.   **DOUBLE SPEED FREQUENCY**
This parameter sets the frequency applied to the two wire speeds set with the DOUBLE SPEED AMPL. parameter.
Available range: minimum (0.0 Hz) - default (2.0 Hz) - maximum (5.0 Hz)
4.   **DOUBLE SPEED AMPL.**
The parameter generates the two wire speeds (high and low) used in the double pulse mode, which are alternated with the frequency specified by the DOUBLE SPEED FREQUENCY parameter.

Available range: minimum (0 %) - default (50 %) - maximum (100 %)

5.   **DOUBLE SPEED DUTY**
This parameter adjusts the high speed time.

Available range: minimum (10 %) - default (50 %) - maximum (90 %)

6.   **DOUBLE SPEED ARC LEN**
This parameter corrects the synergic voltage value relative to the synergic point of the synergic and pulse MIG/MAG processes, while it manages correction of the voltage of the low value in the MIG/MAG double pulse process.

Available range: minimum (-10) - default (0.0) - maximum (10)

6.2.2   POWER MIX PARAMETERS

The parameters that can be adjusted from this menu only affect the POWER MIX welding process and do not change the "Arc length correction" and "Dynamics" parameters displayed on the main page, which only refer to the pulsed arc welding process.
1.   **PULSED ARC TIME CORRECTION**
The parameter corrects the synergic value of the pulsed arc time.

Adjustment range: minimum (-0.20s) - default (0.00s) - maximum (1.00s)

2.   **SHORT ARC TIME CORRECTION**
The parameter corrects the synergic value of the short arc time.

Adjustment range: minimum (-0.20s) - default (0.00s) - maximum (1.00s)

3.   **SHORT ARC WIRE SPEED CORRECTION**
The parameter corrects the synergic value of the wire speed during the short arc period.

Adjustment range: minimum (0.0m/min) - default (0.0m/min) - maximum (5.0m/min)

4.   **SHORT ARC HEIGHT CORRECTION**
The parameter corrects the synergic value of the voltage.

Adjustment range: minimum (-10) - default (0.0) - maximum (+10)

6.3 SETTING THE JOB SELECTION

When the JOB SEL function is enabled, the torch trigger operates in 4 stroke or crater filling 4 stroke mode with the Bilevel functions disabled. Therefore, if jobs are saved with different modes, they are automatically shown according to these conditions (which are not saved).
The JOBs in a sequence can be scrolled through when welding is not taking place by quickly pressing and releasing the torch trigger.

Scrolling the JOBs with an UP/DOWN torch

When an UP/DOWN torch is installed, JOBs can be selected in a JOB sequence using the triggers on the welding torch. To create the JOB sequence, leave a free memory slot before and after the group of JOBs to be included in the sequence.

Sequence 1			JOB not saved	Sequence 2			JOB not saved	Sequence 3		
J.01	J.02	J.03		J.05	J.06	J.07		J.09	J.10	J.11

Select and load one of the JOBs in the desired sequence (for example J.06).
By using the torch UP/DOWN keys, all the JOBs in sequence 2 can be scrolled (J.05,J.06,J.07).
When the torch UP/DOWN key is pressed again, the arc length can be changed.
1. Press the (MENU) key.
2. Turn the encoder to select the desired item. Select the following path: Welding setup>
3. Press the key (ENCODER) to confirm your selection.
WELD THE WORLD

4. Turn the encoder to select the desired item. Select the following path: Torch trigger>
5. Press the (ENCODER) key to confirm your selection.
6. Press the (ENCODER) key to enable function selection.
7. Turn the encoder to select the JOB SEL function.
8. Press the (ENCODER) key to confirm your selection.

Press the ⬅ (PREC) key to return to the previous screen.

To return to the main screen, press the ⬆ (EXIT) key.

6.4 SETTING THE B-LEVEL

1. Press the (MENU) key.
2. Turn the encoder to select the desired item. Select the following path: Welding setup>
3. Press the (ENCODER) key to confirm your selection.

9. Turn the encoder to select the desired parameter.
10. Press the (ENCODER) key to apply the parameter change.
11. Turn the encoder to set the desired value.
12. Press the (ENCODER) key to confirm your selection.
Press the ⬅ (PREC) key to return to the previous screen.

To return to the main screen, press the ➡ (EXIT) key.

SPOT WELDING TIME
When the torch trigger is pressed the welding arc persists for the time set in the parameter.
Press the torch trigger again to resume the welding process.
The welding process cannot be interrupted once it has been started.
When the torch trigger is pressed, if the arc does not strike within 10 seconds, the process is deactivated.
The welding parameters can be modified during the welding process.

Adjustment range: minimum (0.0 s) - default (0.0 s) - maximum (25.0 s)

PAUSE TIME
The parameter sets the pause time after the spot pulse.

Adjustment range: minimum (0.0 s) - default (0.0 s) - maximum (25.0 s)

6.6   K DEEP PROCEDURE SETUP

☞   The procedure can be enabled when an HC curve has been loaded.

K DEEP is a procedure aiming at stabilising penetration and uses the wire speed variation to keep the arch height constant and obtain a more uniform weld bead as regards width and depth.

1.   Press the (MENU) key.
2.   Turn the encoder to select the desired item. Select the following path: Welding setup>
3.   Press the (ENCODER) key to confirm your selection.

4.   Turn the encoder to select the desired item. Select the following path: K Deep>
5.   Press the (ENCODER) key to confirm your selection.
6.   Press the (ENCODER) key to enable function selection.
7.   Turn the encoder to select the desired item. Select the following path: ON

Press the ⬅ (PREC) key to return to the previous screen.

To return to the main screen, press the ➡ (EXIT) key.

6.7 SETTING DSI (Digital Sense Ignition) PROCEDURE

☞ The procedure can be enabled when an HC curve has been loaded.

Digital Sense Ignition enables wire spatter and explosions to be almost totally eliminated during the cold ignition phase and during energy transmission to the workpiece. DSI enables:
- splashes onto stainless steel to be reduced by 60% during the ignition phase
- splashes onto carbon steel to be reduced by 30% during the ignition phase
- ignition with short-circuited wire to be optimized with significant reduction of splashes and explosions.

1. Press the (MENU) key.
2. Turn the encoder to select the desired item. Select the following path: Welding setup>
3. Press the (ENCODER) key to confirm your selection.

4. Turn the encoder to select the desired item. Select the following path: K Deep>
5. Press the (ENCODER) key to confirm your selection.
6. Press the (ENCODER) key to enable function selection.
7. Turn the encoder to select the desired item. Select the following path: ON

Press the ⬅ (PREC) key to return to the previous screen.

To return to the main screen, press the ⤷ (EXIT) key.

7.2 SETTING THE PROCESS PARAMETERS

The ▤ (PARAMETERS MENU) key allows the user to access the menu used to set the main welding features.

1. Press the (MENU) key.
2. Turn the encoder to select the desired setting. Select the following path: Process>
3. Press the (ENCODER) key or the (NEXT) key.
4. Turn the encoder to select the parameter to be changed.
5. Press the (ENCODER) key to confirm your selection.
6. Turn the encoder to set the desired value.
7. Press the (ENCODER) key to confirm your selection.

8.   Turn the encoder again to select other parameters.

To return to the main screen, press the ⯈ (EXIT) key.

7.2.1   MMA PARAMETERS (PARAMETRESMENU)
1.   **HOT START**
This parameter aids electrode melting at the time of arc striking. It is set as a percentage referred to the value of the WELDING CURRENT. The value is limited to 250A max.

Adjustment range: minimum (0 %) - default (50 %) - maximum (100 %)

2.   **ARC FORCE**
This parameter helps to avoid electrode sticking during welding. It is set as a percentage referred to the value of the WELDING CURRENT.

Adjustment range: minimum (0 %) - default (40 %) - maximum (200 %)

3.   **VOLT END**
The parameter sets the voltage value once the welding process is exited by lifting the electrode To exit the MMA welding process the electrode must be lifted considerably; set the parameter at a low value to stop the welding process by slightly lifting the electrode. In this way, less welding spatters are produced and the workpiece is cleaner.
Be careful when setting the parameter because a too low value can lead to frequent welding interruptions.

Adjustment range: minimum (20 V) - default (50 V) - maximum (70 V)

Code 006.0001.2250
22/02/2023 V.1.2

7.2.2   MMA PARAMETERS (MAIN SCREEN)

The following welding parameters can be set on the main screen in addition to the parameters menu.
1.   Turn the encoder to select the parameter to be changed.
2.   Press the (ENCODER) key to confirm your selection.
3.   Turn the encoder to set the desired value.
4.   Press the (ENCODER) key to confirm your selection.
INDUCTANCE
A low-value parameter allows to obtain a softer arc and fewer spatters while a higher value allows to obtain an harder and more stable arc.
With "CC" (constant current) setting, preset welding current is constantly output. This setting is recommended for welding processes with basic, rutile and stainless steel electrodes.
With "Dyn" setting, the current output remains constant (the arc tension increases and the current output decreases when the electrode is lifted).
This setting is recommended for welding processes with cellulose electrodes to carry out route passes onto pipes and with aluminium electrodes to improve arc stability especially at reduced current values.

Adjustment range: minimum (CC constant current) - default (CC) - maximum (Dyn)

Turn the encoder again to select other parameters.

8 ARC AIR WELDING

8.1 SETTING THE ARC AIR PROCESS
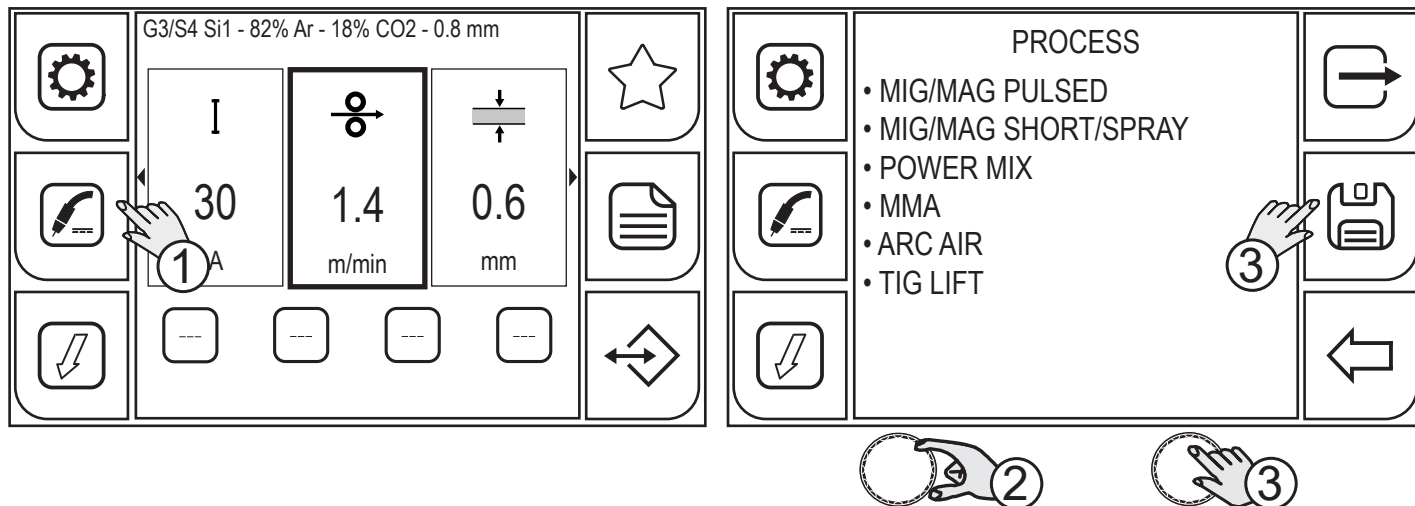

1. Press the (PROCESS) key.

9.2.1   PROCESS PARAMETERS WITH TORCH TRIGGER IN 2 STROKE AND 4 STROKE MODE
1.   **SLOPE CURRENT**
The parameter sets the time during which the current changes from the welding value to the end value by means of a slope. Prevents the formation of craters in the process of turning off the arc.

Adjustment range: minimum (0.0 s) - default (1.0 s) - maximum (20.0 s)

2.   **FINAL CURRENT**
The parameter sets the final current value. During electrode welding the parameter makes it possible to obtain a uniform deposit of filler material from the start to the end of the welding process, closing the deposition crater with a current such as to deposit a final droplet of filler material.

Adjustment range: minimum (0 A) - default (50 A) - maximum (500 A)

3.   **POST GAS**
Time of post gas delivery when the welding arc is extinguished.

Adjustment range: minimum (0.0 s) - default (2.0 s) - maximum (20.0 s)

9.2.2 TIG LIFT 2T OPERATION

10 JOBS MANAGEMENT

Personalised welding settings, or JOBs, can be saved in memory locations and subsequently uploaded.
The Job entails saving the image of all the parameters set in the device. The device parameters are: wire speed, welding arc correction, inductance/dynamic, slopes, torch button mode, process, program used, special functions, guard limits etc...
The settings of the SETUP menu are not saved.
100 JOBs are available.
This function is available when welding mode is not active.
1. To enter the JOB menu, press the (JOB) key.

10.1 CREATING A JOB

Enter the JOB screen.
1. Press the (CREATE JOB) key. The JOB position selection screen will appear.
2. By using the encoder select the JOB position.
3. Press the (ENCODER) key or the (NEXT) key. The keyboard will appear to write the name of the job.

10.1.1 KEYBOARD FUNCTIONS

1. exiting without saving changes
2. JOB position
3. JOB name
4. upper-case

5. numbers/special characters
6. space bar
7. delete text
8. save
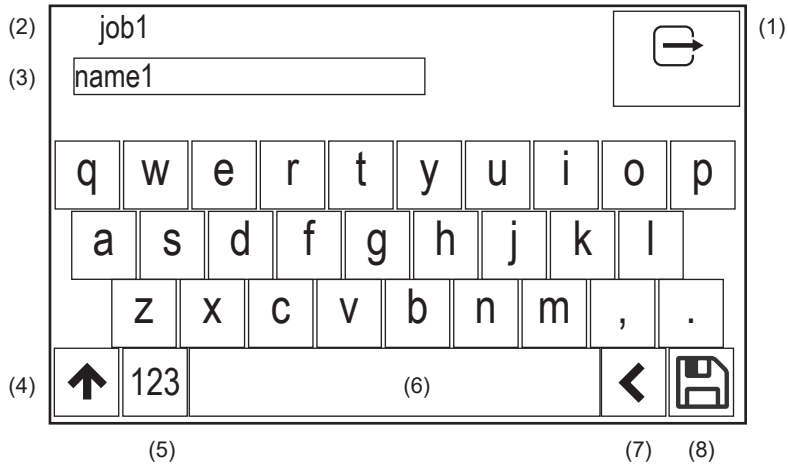

☞ The touchscreen panel allows the welder to set up the functions through the mechanical keys or by touching the icons displayed on the screen.

10.1.2 NAMING A JOB
1. Turn the encoder to select the letter on the keyboard.
2. Press the (ENCODER) key to confirm your selection.
3. Turn the encoder to select the (SAVE) symbol on the keyboard
4. Press the (ENCODER) key to save and exit.

Press the key ⬁ to exit without saving.

10.3 LOADING A JOB

Enter the JOB screen, which contains the list of stored JOBS.
1. Select the JOB to be loaded by using the encoder.
2. Press the (ENCODER) key or the (LOAD) key.
3. The main screen appears with the name of the loaded job.

10.4 DELETING A JOB

Enter the JOB screen, which contains the list of stored JOBS.
1. Select the JOB to be deleted by using the encoder.
2. Press the (DELETE) key.
3. Press the (ENCODER) key or the (YES) key to confirm,
4. or the (NO) key to return to the previous screen.

10.5 EXPORTING JOBS

Enter the JOB screen.
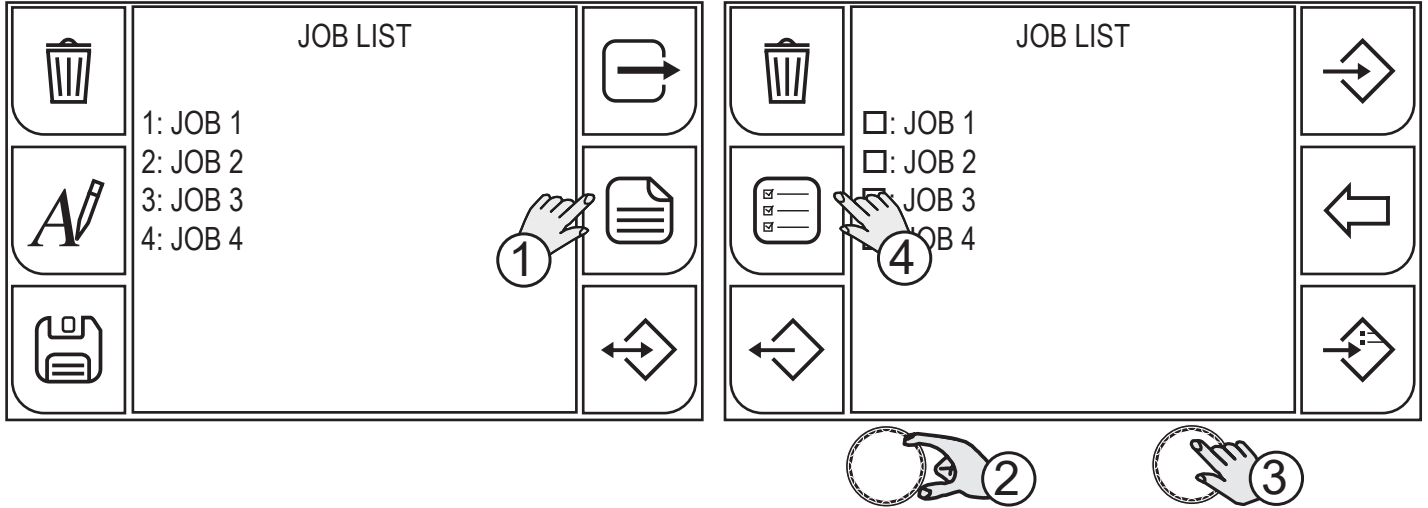

1.　Press the (MENU) key.
2.　Select the JOB to be exported by using the encoder.
3.　Press the (ENCODER) key to confirm your selection.
4.　If you wish to select/deselect all the JOBS, press the (SELECT ALL) / (DESELECT ALL) key.
5.　Insert the USB memory stick in the port provided.
6.　Press the (EXPORT) key to export the files to the USB memory stick. If the exporting operation is success-ful, the message "Selected jobs exported" will appear.
7.　Press the (OK) key

Press the ⬅ (NO) key to return to the previous screen.

To return to the main screen, press the ➡ (EXIT) key.

12 RESET

The reset procedure is useful in the following cases:
- Too many changes made to the welding parameters so user finds it difficult to restore defaults.
- Unidentified software problems that prevent the current generator from functioning correctly.

12.1 RESET PARAMETERS

The reset procedure involves restoring the parameter values and settings, except the following settings:
- System menu settings.
- Saved JOBs.
G3/S4 Si1 - 82% Ar - 18% CO2 - 0.8 mm

30 A   1.4 m/min   0.6 m

PARAMETERS MENU

• Process   >
• Double pulse   >

WECO
WELD THE WORLD

| CODE	MEANING	SOLUTION
E02	**NTC DISCONNECTED** This indicates that the information between the NTC and the monitoring system is no longer being sent.	Qualified technical staff must be called out to carry out the repairs/maintenance operations.
E04	**VOUT DISCONNECTED** This indicates that there is a short-circuit between the welding sockets (+) and (-).	- Make sure that the welding torch is not touching the earthed workpiece to be welded. - Make sure that, when the generator is switched on, there is no short-circuit between the sockets (the voltage must be higher than/equal to the Ur). - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
E05	**WELD TORCH TRIGGER PRESSED** This indicates that, when the generator is switched on, a short-circuit has been detected on the torch trigger input. When the problem is sorted out, the current generator will be automatically reset.	- Make sure that the torch trigger is not pressed, stuck or short-circuited. - Make sure that the torch and the torch connector are in good conditions.
E22	**BOOST VOLTAGE HOLE** This alarm indicates that a sudden power outage in the power mains has occurred.	- If the problem occurs frequently, check the stability of the mains power. When the problem is solved, the power generator will be automatically reset.
E23	**BOOST CURRENT LIMIT ALARM** Mains power boost overcurrent	Qualified technical staff must be called out to carry out the repairs/maintenance operations.
E25	**BOOST CURRENT NOT CALIBRATED ALARM** Current phases input is unbalanced	Qualified technical staff must be called out to carry out the repairs/maintenance operations.
E26	**ALARM GROUND CURRENT** Current is re-circulated on the ground circuit	Qualified technical staff must be called out to carry out the repairs/maintenance operations.
E27	**ALARM UNDERVOLTAGE** Low power supply voltage	- Make sure the mains power does not go below the minimum permitted values.
E28	**ALARM OVERVOLTAGE** High power supply voltage	- Make sure the mains power does not exceed the maximum permitted values.
E29	**ALARM PHASE MISSING** A phase is missing	- Make sure that all the three phases reach the equipment from the power mains. - Make sure that the line fuses on the power supply panel are intact. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.

| CODE	MEANING	SOLUTION
E30	**ALARM OVERCURRENT** The main current threshold has been exceeded	- The welding currents are close to the maximum threshold: reduce the welding parameter values. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
E31	**INVERTER THERMAL ALARM** Indicates that the welding power generator thermal cut-out switch has tripped.	- Leave the equipment switched on to ensure a faster cooling of the overheated components. When the problem is solved, the power generator will be automatically reset. - Make sure that the fans are working correctly. - Make sure that the power required by the current welding process is lower than the maximum specified power. - Make sure that the operating condition complies with the power generator nameplate. - Make sure that the air flowing around the power generator is adequate.
E32	**SECONDARY THERMAL ALARM** Indicates that the welding power generator thermal cut-out switch has tripped.	
E33	**GENERAL THERMAL ALARM** Indicates that the welding power generator thermal cut-out switch has tripped.	
E50	**WARNING COOLING SYSTEM** Indicates insufficient pressure in the torch cooling circuit.	- Make sure that the cooling unit is correctly connected. - Make sure that the O/I switch is set to "I" and that its led goes on when the pump is enabled. - Make sure that there is enough coolant in the cooling unit. - Make sure that the pump delivers the coolant (external bypass present) - Make sure that the cooling circuit is in good conditions, specially the torch hoses and the internal connections of the cooling unit. - Make sure that the fans are working correctly. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
E51	**COOLING UNIT ALARM** The coolant temperature exceeds the threshold	
E52	**COOLING UNIT NTC ALARM** NTC on the CU disconnected	Qualified technical staff must be called out to carry out the repairs/maintenance operations.
E60	**MOTOR CURRENT ALARM WF** High motor input current	- Make sure that the motor is not mechanically blocked by an object. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.

WECO
WELD THE WORLD

CODE	MEANING	SOLUTION
E70	**NO GAS ALARM** Gas flow not detected	- Check the gas flow rate in the system connected to the device. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
E81	**ALARM HIGH CURRENT LIMIT EXCEEDED**	- Make sure that the guard limit parameter is correct according to the preset welding parameter.
E82	**ALARM LOW CURRENT LIMIT EXCEEDED**	- Make sure that that are no welding problems associated with the consumable, gas used, welding position, earth, torch, wire feeder, special functions enabled (K-Deep).
E83	**ALARM HIGH VOLTAGE LIMIT EXCEEDED**	- Make sure that the guard limit parameter is correct according to the preset welding parameter.
E84	**ALARM LOW VOLTAGE LIMIT EXCEEDED**	- Make sure that there are no welding problems associated with the consumable, gas used, welding position, ground terminal, torch, wire feeder, special functions enabled.
E85	**ALARM HIGH WIRE SPEED LIMIT EXCEEDED**	- Make sure that the guard limit parameter is correct according to the preset welding parameter.
E86	**ALARM LOW WIRE SPEED LIMIT EXCEEDED**	- Make sure that that are no welding problems associated with the consumable, gas used, welding position, ground terminal, torch, wire feeder, special functions enabled (K-Deep).
E87	**ALARM HIGH GAS FLOW LIMIT EXCEEDED**	- Check the gas flow rate in the system connected to the device. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
E88	**ALARM LOW GAS FLOW LIMIT EXCEEDED**	- Check the gas flow rate in the system connected to the device. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
E89	**MOTOR HIGH CURRENT LIMIT EXCEEDED ALARM**	- Make sure that the guard limit parameter is correct according to the preset welding parameter. - Make sure that that are no welding problems associated with the consumable, the welding position, the torch, the wire feeder. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.

CODE	MEANING	SOLUTION
W81	**WARNING HIGH CURRENT LIMIT EXCEEDED**	- Make sure that the guard limit parameter is correct according to the preset welding parameter.
W82	**WARNING LOW CURRENT LIMIT EXCEEDED**	- Make sure that that are no welding problems associated with the consumable, gas used, welding position, earth, torch, wire feeder, special functions enabled (K-Deep).
W83	**WARNING HIGH VOLTAGE LIMIT EXCEEDED**	- Make sure that the guard limit parameter is correct according to the preset welding parameter.
W84	**WARNING LOW VOLTAGE LIMIT EXCEEDED**	- Make sure that there are no welding problems associated with the consumable, gas used, welding position, ground terminal, torch, wire feeder, special functions enabled.
W85	**WARNING HIGH WIRE SPEED LIMIT EXCEEDED**	- Make sure that the guard limit parameter is correct according to the preset welding parameter.
W86	**WARNING LOW WIRE SPEED LIMIT EXCEEDED**	- Make sure that that are no welding problems associated with the consumable, gas used, welding position, ground terminal, torch, wire feeder, special functions enabled (K-Deep).
W87	**WARNING HIGH GAS FLOW LIMIT EXCEEDED**	- Check the gas flow rate in the system connected to the device. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
W88	**WARNING LOW GAS FLOW LIMIT EXCEEDED**	- Check the gas flow rate in the system connected to the device. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
W89	**MOTOR HIGH CURRENT LIMIT EXCEEDED WARNING**	- Make sure that the guard limit parameter is correct according to the preset welding parameter. - Make sure that that are no welding problems associated with the consumable, the welding position, the torch, the wire feeder. - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.
E99	**GENERAL ALARM** This indicates that the generator has not been identified.	Check the connections between the generator and the remote devices (wire feeders, remote controls, other devices). - If the problem persists, qualified technical staff must be called out to carry out the repairs/maintenance operations.

16 SERVICE

The service menu is used to activate additional functions; the password is not provided to the end user as these functions are activated by qualified technical personnel, only authorised by the manufacturer to carry out maintenance and troubleshooting tasks.
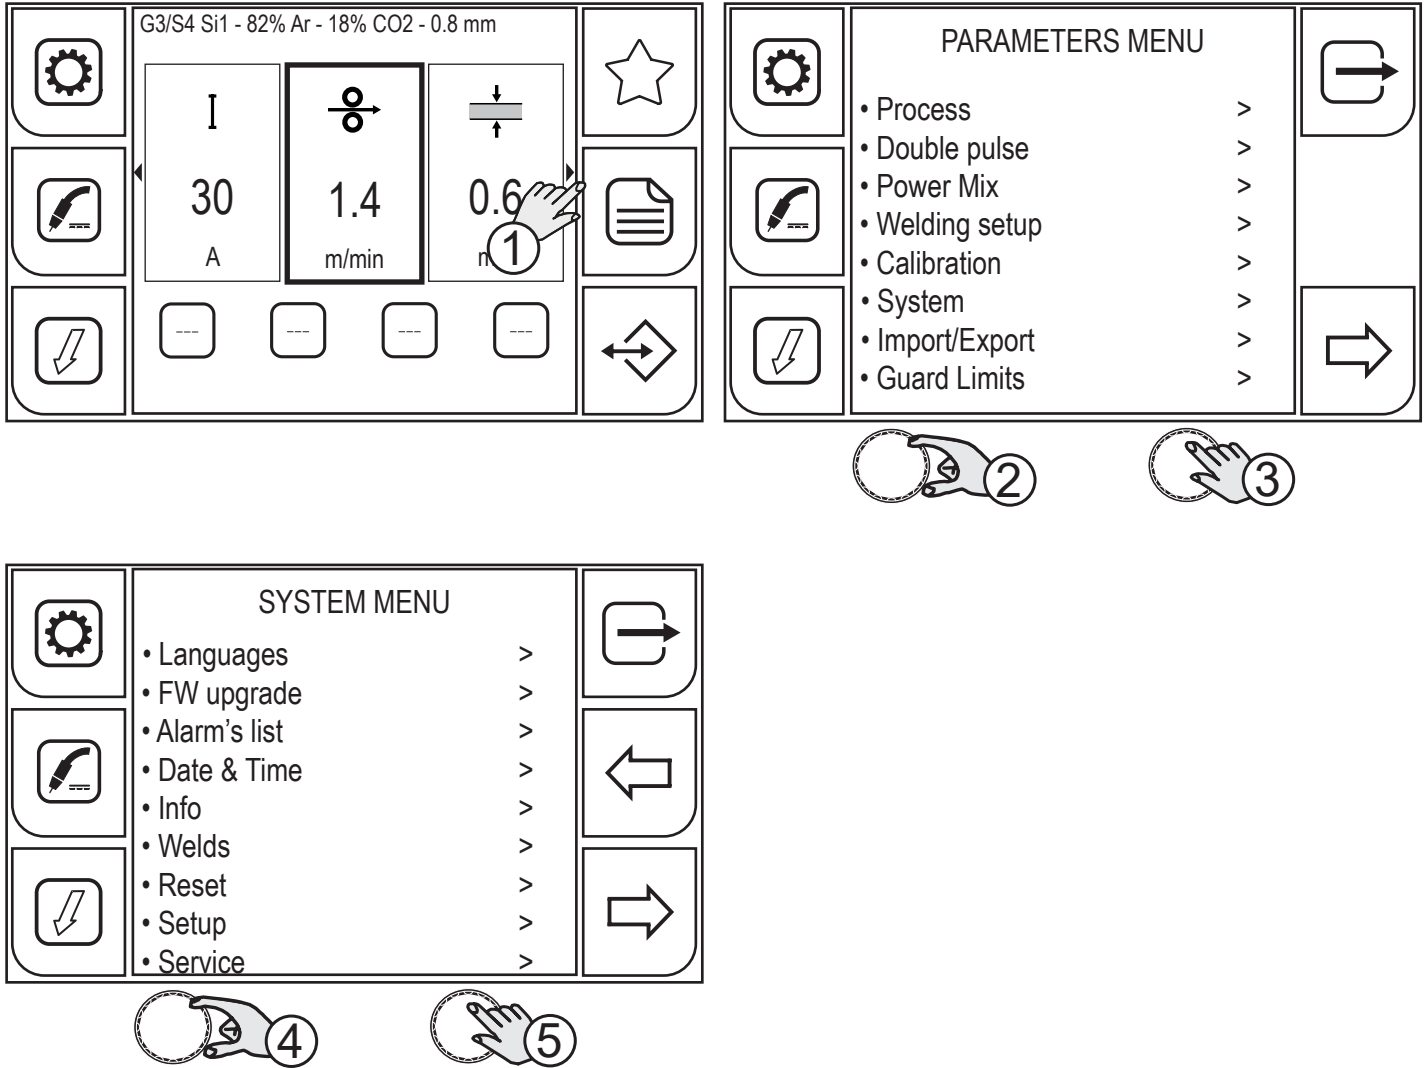

17 TECHNICAL DATA

| Directives applied	Waste electrical and electronic equipment (WEEE)
	Electromagnetic compatibility (EMC)
	Low voltage (LVD)
	Restriction of the use of certain hazardous substances (RoHS)
Conformity markings	CE Equipment compliant with European directives in force
	S Suitable in an environment with increased hazard of electric shock
	Compliant with WEEE directive
	RoHS Equipment compliant with RoHS directive
Construction standards	EN 60974-1 EN 60974-10 Class A

17.1 RC-205 TECHNICAL DATA

Supply voltage	15 V d.c.
Weight	1,3 Kg
Protection rating	IP23
